

Employee Management System

Create an **Employee Management System** using **HTML and JavaScript**.

Requirements

- Create an employee form with:
 - Name
 - Email
 - Department
- Create an **Employee Constructor Function** to create employee objects.
- Generate a random salary between **100 and 1000** for each employee.
- Store all employees inside an **array of objects**.
- Display employees in an HTML table with:
 - Employee Name
 - Email
 - Department
 - Salary
- Calculate and display the **total salary** of all employees.
- Store the employee array in **Local Storage** using `JSON.stringify()`.
- Retrieve the saved employees from Local Storage using `JSON.parse()`.
- Make sure employee data remains available after **refreshing the page**.
- Render the stored employees automatically when the page loads.
